Practice settings may benefit from certain operational efficiencies that support a separation of the vaccine preparation steps from vaccine administration to the patient. For example, this may occur when a practice setting prepares and pre-draws the vaccine into syringes or prepares the vaccine in vials in one area and then transports the pre-drawn syringes or vials to a different site for administration. It is critical to use pre-drawn syringes with the earliest discard time first to avoid waste. If pre-drawn syringes are used, consider the following manufacturer-released information supporting stability of vaccine in vials and in pre-drawn syringes.

**Pfizer-BioNTech COVID-19 Vaccine**

Pfizer has conducted physical and chemical stability studies which have shown that the vaccine maintains all its measured quality attributes when diluted vaccine is stored in polycarbonate and polypropylene syringes with stainless steel needles for 6 hours at 2°C to 25°C (36°F to 77°F) after the source vial is diluted.

Microbiological risk was assessed through a microbiological challenge study which showed that microbiological growth has a greater potential to occur after 6 hours. The hold time of 6 hours, from the time the source vial is diluted, is not specifically tied to a preparation environment and can be applied to doses prepared outside of ISO Class 5 environment (PEC).

Keep out of direct sunlight.

**Moderna COVID-19 Vaccine**

According to the Chemistry, Manufacturing and Control (CMC) department at Moderna, pre-drawn syringes can be either stored in the refrigerator or ambient room temperature at 2°C to 25°C (36°F to 77°F) provided they are administered within 6 hours of the first time the source vial is punctured.

Per Moderna, common disposable syringes made of polypropylene or polycarbonate are suitable for use.

Keep out of direct sunlight.

Continued on next page
According to Janssen Biotech, Inc. based on data on file, pre-drawn syringes can be stored:

- In the refrigerator at 2°C to 8°C (36°F to 46°F) provided they are administered within 6 hours of the first time the source vial is punctured.

- In ambient room temperature up to 25°C (77°F) provided they are administered within 2 hours of the first time the source vial is punctured.

Per Janssen Biotech, Inc., common disposable syringes made of polypropylene or polycarbonate are suitable for use.

Keep out of direct sunlight.

* Based on stability information provided by the manufacturers.

**No data is available at this time regarding the cumulative temperature ranges and duration (e.g., kept in refrigerator for 2 hours, then at room temperature for 1 hour, back in the fridge for 2 hours, then at room temperature for 1 hour). It is preferred to choose one storage condition after first puncture. Any excursions should be reviewed with Janssen’s interactive tool.
